PW SKILLS

EXCEL FUNCTIONS

INSTRUCTIONS

- Use the provided dataset to solve all questions.
- Apply appropriate Excel functions (Logical, Text, Date-Time) wherever required.
- Avoid manual calculations — focus on formula-based solutions.
- Ensure proper cell referencing for dynamic results.
- Maintain clean formatting and readability in your sheet.
- Think logically before applying formulas — some questions may require multiple functions combined.
- Do not use external tools or shortcuts unless instructed.
- Save your file with proper naming convention before submission.
- Be prepared to explain your approach and formulas used.

Focus on understanding the logic, not just getting the answer!

Dataset Context:

You are analyzing an E-commerce Orders Dataset containing order details, customer information, product categories, and delivery timelines.

EASY

Q1. Create a new column that labels orders as:

- “Bulk Order” if Quantity ≥ 3
- Otherwise “Regular Order”

Q2. Extract only the first name from the Customer_Name column.

Q3. Clean the dataset:

- Remove extra spaces in Customer_Name using TRIM
- Convert names to Proper Case

MEDIUM

Q4. Calculate delivery duration (in days) for each order.

Q5. Create a column “Delivery Status” to identify:

- “Late Delivery” if delivery took more than 7 days
- Otherwise “On Time”

Q6. Create a column “Order_Validation” formula to return:

- “Valid” if Status = Delivered AND Quantity ≥ 2
- Otherwise “Review”

MEDIUM

Q7. **Combine Customer_Name and Region in this format and Create new column “Customer_region”**

For eg. : **“Amit Sharma (North)”**

Q8. **Extract the numeric part from Order_ID (e.g., O045 → 45).**

Q9. **Based on the Product column, create a new column “Product_Type”:**

- If Product is **Laptop, Phone, Tablet, Monitor, Keyboard, Mouse, Headphones, Speaker, Smartwatch** → return "**Electronics Item**"
- Otherwise (Chair, Table, Sofa, Bed, Desk, Cabinet) → return "**Furniture Item**"

Use logical functions to categorize products dynamically

HARD

Q10. **Create a validation rule:**

- If Status = Cancelled OR Quantity = 0 →“Invalid Order”
- Else → “Valid Order”

Q11. **Using DATEDIF, calculate**

- **Total order aging (in months)** from Order_Date to TODAY()

Q12. **Generate a dynamic message:**

- Delivered → “Delivered in X days”
- Pending → “Pending for X days” (X = calculated difference)
